### **Relax, Let the Robot Do It: *Automated Parking and the Human Species***

It is safer, you know. We humans are unpredictable and are known for our chaotic disorder. Automated and robotic systems create the antithesis of chaos, bringing order and calm to the humanized world. Fully automated cars are expected to be available in the near future, but what if we told you that automated parking was available today. Not just that, but what if we told you that Simon Design's system would actually help the environment, cost less, save money, and guarantee that each car is safe and that it will take less than 60 seconds to retrieve each car?

Remove the potential for vandalism, the fear as you walk through a dark garage, the concern for you and your car's well being, and the human factor. Simon Design's automated parking facilities eliminate human error and threats, while providing the opportunity for sensible urban growth and earth-friendly, self-sustained operation. Our patented automated parking facility offers a host of advantages, well beyond other robotic parking garages you read about. [MORE...](#)

With Simon Design's automated parking facility, your car is never touched, sat in, rifled through, driven around town, or near another human. The basic idea: you drive onto a large turn table in a covered pod, get out, take a parking ticket, and leave. Moments after you leave, your car is swept away and taken up, or down to the appropriate dock where it will remain with its automobile brethren. Upon your return, you pay your ticket at a pay station located in a pod which alerts the facility that your car is needed. Sixty seconds later, possibly before you can find your keys, your car appears and you drive off. Forget about parking stress; let Simon Design Engineering's automated system be your next parking solution. [MORE...](#)

*Informational Tidbit: Simon Design Engineering has teamed up with [Urban Parking Concepts](#) to provide the Rothary Parking Storage of Switzerland to the US market. [See our system perform.](#)*
